What are the drilling parameters?

Drilling Parameters | UNION TOOL CO. Parameters for drilling and slot drilling, conditions for Drilling in the chart are available. Hits, number of repoints and stack heights are for general information. They should be determined by hole quality.

What are the parameters for drilling and slot drilling?

Parameters for drilling and slot drilling, conditions for Drilling in the chart are available. Hits, number of repoints and stack heights are for general information. They should be determined by hole quality. These parameters can be affected by the condition and performance of both the spindle and drilling machine.

How do I find the optimum ROP for diamond drilling?

The ROP is the key parameter in diamond drilling. Finding the optimum ROP for a given type of rock, ground condition, core bit and type of diamond drill rig will improve drilling performance. To find the optimum ROP, you should start by using the ROP suggested on the bit label.

What is ROP in a diamond drill?

The Rate of Penetration (ROP) is the key parameter when drilling with impregnated bits. Finding the optimum ROP for a given rock type, rock condition, bit and model of diamond drill is the goal of the professional diamond driller. Once found, this ideal ROP is maintained by adjusting the WOB and RPM.

What is a rate of penetration (ROP) in diamond drilling?

Epiroc has worldwide experience and specially trained representatives to assist you. The Rate of Penetration (ROP) is the key parameter when drilling with impregnated bits. Finding the optimum ROP for a given rock type, rock condition, bit and model of diamond drill is the goal of the professional diamond driller.
