

## Abnormal sound when screw air compressor starts up the belt

Why does my rotary screw air compressor make a strange noise?

An unusual noise in a rotary screw air compressor is most likely due to worn airend bearings. Pay close attention to oil leaks and strange noises from the motor bearings as these are the two main indicators of potential issues with the air compressor.

How to deal with abnormal noises in air compressors?

Here are some aspects to consider when dealing with abnormal noises in air compressors: Cause 1: Malfunction of the Silencing System, which mainly consists of brackets, sealing strips, door panels, and sound insulation cotton. Treatment: Check the above components for any damages and ensure that the fixing bolts are tightened securely.

What could cause the aircon compressor belt to make noise?

Another reason for this noise is that the belt connecting the engine crankshaft to the compressor is loose, frayed, or slipping. The aircon compressor is held in place by mounting bolts. After many thousands of miles, these can start to corrode and work loose. Inspect the compressor to look for signs of this.

What causes a/c compressor noise?

Here are some of the more common types and causes of A/C compressor noise. Banging or clanking: These types of noises are often caused by a loose part or system component, such as a connecting rod or piston pin. Usually, the only solution is to replace the compressor.

Why is my AC compressor clutch making a noise?

One possible cause for the noise is dry blower motor bearings. Other potential issues include a damaged belt tensioner or dislocated pulley system. To temporarily reduce the noise, you can spray water on the AC belt. However, addressing the root cause, such as fixing the belt tensioner or pulley system, is recommended.

Why does my air compressor make a squealing noise?

Air compressors can produce various types of noises, such as rattling, banging, hissing, or squealing. Each noise type can point to different issues. For example: Rattling usually indicates loose parts or components. Banging could suggest problems in the air tank or issues with the motor mounts.
