What to do if drilling doesn't work?

If drilling doesn't work, you can build a raised bed as an alternative. The passage also mentions the possibility of filling in a blast hole, but notes that it might be more work than digging. Additionally, there are 'bulb augers' that can be bought and attached to your drill to make wider holes than a drill bit alone, but it's unclear if they're effective for drilling into really hard ground.

How high can a hammer drill a hole?

There are six sizes available, starting at just seven feet high. Numa designs and manufactures rock drilling hammers and bits for vertical and horizontal applications. Their U.S. made Down-the-Hole and HDD hammers and bits can drill holes from 3.5 inches to 50.5 inches (89mm-1283mm).

How do you drill a hole in a rock?

For very hard rock or to break up boulders, the down-the-hole drilling method is used. A hammer is mounted on the drill bit at the end of the drill rod. Compressed air is used to pneumatically break and remove the rock or boulders. The bit breaks up the rock by rotating and impacting at the same time.

What kind of drill do I need to plant pots?

If you want to use a drill, a large masonry bit would be suitable. Rental yards offer aerators that punch holes a few inches into the soil, or you could rent a rear-tine tiller to open up the entire surface. However, all you really need is a hole large enough for a 6-inch pot.

What is a down-the-hole drill rig?

The purpose of a down-the-hole drill rig is to drill large-diameter holes downwards, consisting of a jackhammer screwed to the bottom of a drill string. Like other drill rigs, the DTH breaks up the rock so it can be flushed out using air or water.

What happens if you dig a hole below ground level?

If you dig a hole below ground level in impermeable soil, it will fill with water and kill anything by drowning its roots. You also need to scratch out a ditch leading downhill from the deepest part of each hole, so water has a place to drain down to.
