

Diesel air compressor does not produce air

Why is my air compressor not building pressure?

If the pressure gauge does not rise, there may be an issue with the pressure switch or other components of the compressor. Remember, testing the pressure switch is just one step in troubleshooting why your air compressor is not building pressure. Be sure to check other potential causes, such as a faulty motor, air leaks, or a clogged air filter.

Why is my air compressor low discharge pressure?

Low Discharge Pressure in Your Air Compressor When Your Compressor Runs, But Pressure Doesn't Build If your air compressor is running but your pressure gauge barely moves (or takes forever to build pressure) you're likely dealing with a discharge pressure issue. This problem can show up in any compressor type, from rec

Why does my air compressor take a long time to build pressure?

An air compressor may take a long time to build pressure due to a faulty air-intake pump that needs to be replaced. Check for lack of pump pressure manually with protective gloves. This can be identified if the motor is running and making noise, but no air comes out. Why Is My Compressor Pressure Low?

Why does my air compressor keep overheating?

Aside from not delivering enough air for the air tool, this issue can create another problem. An air compressor that will not build pressure runs on long past the point where it normally would reach the cut-out pressure level and stop. The result is the compressor motor will overheat.

Why is my compressor pump not working?

It is possible that back pressure in the tank from the building pressure is increasing load to the motor, and if it isn't a pump issue, then it points to the motor, and the usual cause for that type of issue is a failing run capacitor on the motor. There is a link on this page about how to test the capacitor (s) on the compressor motor.

How do I know if my air compressor pump is bad?

Feel for lack of pump pressure manually with a pair of protective gloves. Additionally, look out for strange noises, excess moisture, warm air, a shaky unit, circuit breaker issues, low air pressure, or if the compressor stops working, as these could be signs of a bad air compressor pump.
