

Does the screw air compressor lubricating oil contain water

Does a screw air compressor need lubrication?

Lubrication is one of the most essential elements in the efficiency and longevity of any piece of machinery. (especially rotating equipment). A screw air compressor is no different and it requires lubrication to work excellently and efficiently. An exclusive oil is used for screw air compressors that differ from motor oil and other common oil.

Does a compressor lubricant have water?

Water can be present in a compressor's lubricant circuit in both a dissolved state and a free state. Lubricants, like air, have a saturation point. Depending on the type of lubricant, a certain amount of water will be dissolved in the fluid. Once the lubricant reaches its saturation point, additional water will condense to form free water.

Why is lubricant important in rotary screw compressors?

Lubricant is a critical component in rotary screw compressors. Understanding the characteristics of lubricant types helps ensure their proper application and increases customer satisfaction by extending the service life of compressors.

What is a compressor lubricant?

We offer a full range of compressor oils that lubricate the moving parts of compressors to improve performance, lower maintenance costs and reduce the formation of harmful deposits. Compressor oils are specially formulated for the type of compressor, gas to be compressed, discharge temperature and pressure.
WHAT DOES A COMPRESSOR LUBRICANT DO?

What kind of oil does a rotary screw air compressor use?

Generally, rotary screw air compressors use synthetic oil, while recreational compressors may use standard oil. Air compressor oil varies in composition and color but is often yellow or light brown and becomes darker as it becomes contaminated over time. Why do rotary screw air compressors need oil?

How does an air compressor lubricant valve work?

When the air compressor is first started, and the oil is cold, this valve will direct our oil straight into the air end and bypass the oil cooler. This will ensure the lubricant heats up quickly and can effectively perform all the tasks we demand of it.
