

How does a down-the-hole drill work?

Down-the-hole drills consist of various components such as hammers, bits, and pipes that work together to create boreholes. The hammer delivers rapid blows to the bit, while air pressure removes debris from the hole. These tools are designed to withstand high-impact forces and provide exceptional performance in challenging environments.

Can a hammer be used to drill a hole?

When drilling holes in water-bearing rock, never leave the hammer at the hole bottom with the air supply switched off. If drilling is to be suspended temporarily, always pull up the hammer by at least two pipe lengths. Clean around the driver chuck before changing the drill bit. Make sure the shank of the new drill bit is clean.

How do you change a hammer drill bit?

If drilling is to be suspended temporarily, always pull up the hammer by at least two pipe lengths. Clean around the driver chuck before changing the drill bit. Make sure the shank of the new drill bit is clean. Keep the hammer clean and plug both ends when not in use. Change worn or damaged parts in good time.

What are down-the-hole drilling tools?

Down-the-hole drilling tools are essential for various industries such as mining, construction, and oil and gas exploration. These tools are versatile and can be used for a wide range of applications, from creating blast holes in quarries to installing water wells.

How does a hammer drill work?

When feed force is applied, the drill bit is pushed into the hammer and pressed against the front of the driver chuck. The impact piston (5) strikes the shank of the drill bit directly. The passage of compressed air through the hammer is directed by the piston, control tube (6) and bit bushing (4), which all have regulating ducts.

How do you drill a hole in a bit blow tube?

Avoid pitting at the base of the bit blow tube. Therefore, use just enough water for the drilling conditions present. When drilling is complete, always shut off the water and blow air and oil through the drill string to remove the water and coat internal surfaces with oil. This will
