

Drilling rig core extraction method video

What are the three parts of the core drilling process?

For people who are more visual and who prefer to watch a demonstration than to read about it, these videos are great. This latest video in our series reviews the three parts of the core drilling process: drilling, retrieving the core sample and resuming the drilling. Together they make a round trip and with each one, the bore hole gets deeper.

What is a drill rig?

A drill rig is the main equipment used to drill down into the earth to get core samples. It is mounted with different types of drill bits, core barrels, and other extractive tools so a portion of the drilling process can be recovered and extracted from the subsurface. Core barrels are tubular structures where the core is collected as it is drilled.

What are the different types of core extraction methods?

The key methods are listed below: Rotary core drilling is the most common core drilling method of core extraction, especially for deep formations. The rotating drill bit with a core barrel cuts through the rock. As the drill advances, the core is collected. This is good for hard rock formations.

How does a core drilling rig work?

Depending on the size of the hole, most situations require the drilling rig to be attached to the ground or surface with an anchor, bolt, or vacuum seal to keep the rig stabilized. Because core drilling requires substantial speed and force to get through concrete, a lot of heat is generated during the drilling process.

What is core drilling?

Core drilling is the method of extracting cylindrical pieces of rock or sediment from the earth. These samples are useful in determining the geological characteristics of the natural deposits.

How does percussion drilling work?

A core barrel is lowered in the well with a wireline, and without pulling out the entire drilling rig from the hole, the core sample is brought out. This is very efficient and minimizes time loss during drilling. Percussion drilling uses a large steel drill bit that strikes the surface with a hammer to break through rock.
