What is the purpose of a drilling and sampling program?

The purpose of a drilling and sampling program is to obtain samples that reasonably represent subsurface conditions over the entire project site. Sampling type and frequency is dependent upon both the type of material encountered and the purpose of the investigation.

What are the different types of drilling rigs?

The two most common methods of drilling for soil samples are the wet rotary method and the hollow stem auger. Drilling rigs come in many different sizes, shapes, purposes, and setups. The objective in sampling a soil or rock deposit is to obtain samples that have the least amount of disturbance.

How are drill rig samples Paid?

Driven split barrel samples and thin-walled tube samples are paid on an each basis. Rock core of various sizes is paid by the linear foot (meter). We pay the contractor to mobilize the drill rigs whether on land, or water (floating) or on water using a stationary platform (typically, a jackup barge).

How do you drill for soil samples?

The two most common methods for drilling soil samples are the wet rotary method and the hollow stem auger. The objective in sampling a soil or rock deposit is to obtain samples that have the least amount of disturbance. The level of the groundwater at a site is a very important piece of information for any geotechnical investigation.

What is rock coring and sampling by rotary drilling methods?

Rock coring and sampling by rotary drilling methods are detailed in ASTM D2113. Rock coring includes four components: (i) core bit, (ii) core barrel, (iii) drill rod, and (iv) drilling fluids.

What are the two most common methods of drilling for soil samples?

The two most common methods of drilling for soil samples are the wet rotary method and the hollow stem auger. About two to six soundings are performed for average size buildings and bridges. Drilling rigs come in many different sizes, shapes, purposes, and setups.
