

How to Unload a Screw Air Compressor

How do you unload a screw compressor?

In simpler terms, unloading a screw compressor involves closing the inlet valve to stop the flow of air into the compressor, causing it to halt operation. When Is Unloading a Screw Compressor Used? Unloading a screw compressor is employed when there is no demand for compressed air in the system.

What does unloading a screw compressor mean?

Unloading a screw compressor signifies that the compressor is inactive and not producing compressed air. This is done when there is no requirement for compressed air in the system. Unloading the compressor serves to conserve energy and minimize wear and tear on the equipment. How Does Unloading a Screw Compressor Work?

When should you unload a screw compressor?

Unloading a screw compressor is employed when there is no demand for compressed air in the system. This situation typically occurs during periods of low air usage, such as at night or on weekends. Unloading the compressor during these times conserves energy and safeguards the compressor from unnecessary wear and tear.

What is loading a screw compressor?

Loading a screw compressor refers to the operation where the compressor is actively running and producing compressed air. This occurs when there is a need for compressed air within the system.

What happens when a compressor is unloaded?

The compressor then goes into an unloaded state, ceasing to compress air and venting any previously compressed air within the compressor. As the compressor unloads, the system's pressure decreases, and the pressure switch eventually reactivates the compressor when the desired pressure level is reached.

How does a screw compressor suck in air?

There is a small hole, or bypass in the inlet valve that allows the screw compressor to suck in a little bit of air. This air is used to maintain a minimum internal unload pressure. To keep this internal unloading pressure constant, the same amount of air that is sucked in is also blown-off. For this purpose there's a blow-off valve/opening.
