

How to install the pressure box of deepwater drilling rig

Why do we offer multiple configurations for a deepwater drilling rig?

Deepwater drilling operations present many different needs and requirements—a one-size-fits-all approach is difficult to apply. That's why our MPD systems are offered in multiple configurations to allow integration with the rig in a way that makes the most sense for the client.

What is managed pressure drilling (MPD)?

Install a managed pressure drilling (MPD) system on location on a dynamically positioned semi-submersible within a very limited time frame while the rig is conducting deepwater drilling operations. Drill efficiently through karstified carbonate formations prone to severe circulation losses to isolate the same and access deeper target reservoirs.

Can MPD technology be used in deepwater drilling rigs?

Shipyards /Rig designers- now incorporating MPD technologies into next-generation rig designs to expand client offering. Integration of MPD systems into floating mobile offshore drilling units is rapidly becoming the norm; dozens of MPD-ready deepwater drilling rigs equipped currently.

How many manifolds are in a managed pressure drill system?

A typical Managed Pressure Drilling (MPD) system contains four manifolds (buffer, choke, metering and distribution) that are used to control pressure throughout operations. Pictured here are the manifolds on the West Tellus drillship.

Why is deck space important for a deepwater rig?

Always at a premium, deck space is a valuable commodity onboard a deepwater rig. We know that whether for one rig or a rig fleet, MPD systems must maintain a minimal footprint and be sufficiently flexible to accommodate a variety of topside arrangements.

What rig modifications were performed during a drillship en route to drilling location?

Equipment installation and necessary rig modifications were performed while the drillship was en route to drilling location. MPD technologies enabled the operator to drill three hole sections of different sizes, avoid total losses, and manage nuisance gas in a challenging deepwater environment.
