

How to use an industrial screw air compressor

What is a screw compressor?

Screw compressors are the workhorses of industry and manufacturing. These tough industrial air compressors are widely used for applications requiring high efficiency and continuous airflow, including conveyor systems, manufacturing equipment, process manufacturing, and more.

What are the different types of rotary screw air compressors?

There are two basic kinds of rotary screw air compressors: oil-injected and oil-free. Oil-injected screw compressors are the most common type of industrial air compressor and work well for most applications. Within these categories, there are also some subtypes to consider.

How does a screw air compressor work?

As the screws turn, the air is continually compressed. Screw air compressors are widely used for applications that require high CFM (Cubic Feet of air per Minute) and continuous use. This is the most commonly used air compression technology for heavy industrial applications such as powering pneumatic production lines and conveyor systems.

Why do people use rotary screw air compressors?

Most people appreciate rotary screw air compressors because of their longevity, reliability, and easy access to instant air. Because rotary screw air compressors can run continuously, there's no need to wait for an air receiver tank to fill before you can start using the air.

How much noise does a rotary screw air compressor make?

A typical rotary screw air compressor will operate at 65-75 dBA, or somewhere between the noise level of a car engine and a vacuum cleaner. A rotary screw air compressor will also generate less vibration. Cooler Temperatures: Typical internal operating temperatures for a rotary screw air compressor are 140-160°F.

Are rotary screw air compressors good for mobile air tools?

Air tools require the right CFM and psi to operate efficiently. Rotary screw air compressors tend to produce lower psi than reciprocating air compressors, but this isn't a problem for most mobile air applications. Most air tools run at 80 to 110 psi, which is well within the capabilities of rotary screw air compressors.
