What is a hydraulic crawler drill?

Hydraulic breakers that breaks rocks into small pieces. A hydraulic crawler drill is a self-propelled machine for making downward holes in rocks. Our hydraulic crawler drills are used at limestone mines and quarries and for civil engineering work and at construction sites in Japan and abroad and hold the share (70%) in the Japanese market.

Are percussion rock drills hydraulic or pneumatic?

During the last 20 years, most percussion rock drills have been converted from pneumatic to hydraulic operation: in tunneling and construction work, most percussion rock drills are hydraulically driven but a certain number of drills used in mining operations remain pneumatically driven for various reasons.

What are the components of a drilling system?

The essential components of a drilling system are the rock drill, feed equipment, drilling rods, bit, supports against the drilling reaction, power source, and cuttings disposal equipment. Different drilling rigs are constructed with various combinations of these elements and other accessories for particular drilling purposes.

What is a hydraulic drifter drill?

The hydraulic drifter is the core equipment of a hydraulic crawler drill and enables speedy and powerful drilling work. It crushes the hard rock with 80 to 200 revolutions and 2,000 to 5,000 blows per minute, to suit the rock quality.

How does a drilling tool work?

When drilling in rock, the sharp end of the drilling tool, or bit, is driven into the rock by means of a dynamic (percussion, in which the bit rotates slightly in response to each stroke) or static force (rotation). The material excavated by the bit is stripped out of the hole by shearing as the bit advances.
