

# Refrigeration screw air compressor startup procedure

How do I start a compressor if it shuts down?

Insure that the following solenoids turn OFF when the compressor shuts down: oil solenoid valve, economizer solenoid valve, de-superheating solenoid valve. This startup procedure should be followed for each compressor as it is started for the first time. The results of the startup and the startup data should be recorded in the Startup Worksheet.

How to start loncem compressor?

Before starting the compressors the control circuit power should be switched on. At that point,the LonCEM module should have control power to it and the power light (green light in upper right hand corner) should be on. No other lights should be on as the compressor call from the controller should be de-energized.

When should a compressor test be done?

It can be conducted at the factory if final testing is completed on the system before shipment or can be conducted on-site when the refrigeration system and compressors are initially started up. Verification checks to be made after all of the compressors on the rack have been started and are operating.

Should oil be added before starting a compressor?

No oilshould be added to the compressor prior to starting it. Insure that any other feed lines that may be manually closed (including the suction,discharge and economizer service valves) are also opened before starting the compressor. This procedure should be followed once you are ready to begin starting the compressors on a given rack.
