How do you re-grind a rock drill?

Adjust drilling pressures. Regrinding should be done when the wear flats are max. 1/3 of the button diameter. Monitor coupling temperatures and adjust feed pressures according to recommendations. Adjust rotation speed. Use Retrac bits and activate anti-jamming when drilling. Use a rock drill with power extractor.

What happens if you drill in non abrasive rock?

Drilling in non-abrasive rock creates micro-fractures in the carbide sometimes looking like snake skin. The rock leaves a shiny surface Use a softer carbide grade. on the buttons and a fatigue in the surface of the cemented carbide, leading to button failure. Excessive button protrusion through incorrect grinding or steel wash.

What should I do if my drill bit is worn?

Drilling with worn bits Adjust feed and percussion pressures to the rock conditions. Do not engage full percussion unless the bit is firmly seated against rock. Use reduced percussion when collaring on uneven surfaces. Replace worn components. Regrind the bit when the wear flats are max. 1/3 of the button diameter. Misalignment of rods.
