

Rock drill valve assembly installation direction diagram

How do you use a relief valve in a hydraulic breaker?

Stop carrier and remove gauge. Tighten plug of the pressure measuring point. The relief valve is safety device which is used to protect the breaker when pressure rise in hydraulic circuit. The operating pressure of breaker determines the seating of the relief valve in the pressure line.

How to adjust oil pressure inside operation valve cover?

Put shim plate which needs to adjust oil pressure into the center hole inside operation valve cover. Put B,D and E inside C as shown below. Assemble above "A" assembly and above "B" assembly. After putting new O-ring H,G to each O-ring groove, apply grease on O-ring surface and assemble valve housing. hex. wrench. 8mm HEX. WRENCH

How should a pressure valve be oriented during installation?

Attempts to lift a large or heavy valve in this fashion can result in injury to personnel and damage to valve and property. 4 During installation, orient the valve so that the preferred pressure end will be toward the higher pressure, when the valve is closed. 5 This will provide longer valve life and easier operation.

How do I know if the relief valve is working?

Check the hydraulic circuit of the carrier. Check the relief valve operation in the carrier. Check the line size. Assemble an extra oil cooler. Relief valve in hydraulic circuit opens at a low pressure. Hammer operating pressure is not reached Check the installation. Check the relief valve operation. Adjust the relief valve in hydraulic circuit.

Which safety valve should be installed first?

Therefore, the full open safety valve should be installed first and then the "inside" BOP (check valve) installed if it is necessary to strip back in the hole. Three types of inside BOPs can be used: Presently there are alternative valves on the market which have an unrestricted bore with the (flapper) valve retained by a sleeve.

How do you lubricate a diaphragm actuator?

14 O.S.&Y. ORBIT valves equipped with diaphragm actuators are lubricated at the lube point on the adapter sleeve* above the line pressure. Two strokes of the grease gun provide adequate lubrication. Excess grease will make the position indicator difficult to see. actuators have grease fitting installed in actuator case.
