How do you drill a hole in a cylinder?

Drilling cylinder wedge and counter wedges can be inserted. Holes are usually made with a conventional, hand-held pneumatic hammer drill, a simple, straightforward process. In quarries, large machines capable of drilling several holes simultaneously are used. Dust extractors

How do you demolish a concrete pile?

Remove pile head and demolish it with a splitter (2) (Fig. 8.5.2b) by hand. Lightly reinforced concrete: Instead of exposing the reinforcing rods, drill a hole in the side of the pile between reinforcing rods and make a limiting split (1) with a splitting cylinder. Do not enlarge this split excessively

Can a hammer drill be drilled through a rod?

In general, it is advisable to drill between the rods. Reinforcements of 6 - 10 mm thickness can be drilled through with a conventional pneumatic hammer drill, but this is time-consuming and relatively uneconomical. Since no set rules exist for splitting procedures, but merely parameters derived from experience, it is necessary to determine them

How do you force a concrete RT?

Blocks of concrete or rock can be forced apart or lifted. Insert the steel tips of the shears into the split or gap between the blocks of material. Press the control valve lever to 'Open' and hold it in that position. The shear arms will open, forcing the concrete apart as possible (maximum width 32 cm). Fig. 6.3.1
