What is rotary screw air compressor oil?

Air compressor oil plays several vital roles within a rotary screw air compressor system: Rotary screw air compressors are sometimes "oil flooded" or "oil injected," describing that oil is injected into the rotor housing. The oil mixes with the air during compression but is separated back out before the compressed air leaves the system.

Why is lubricant important in rotary screw compressors?

Lubricant is a critical component in rotary screw compressors. Understanding the characteristics of lubricant types helps ensure their proper application and increases customer satisfaction by extending the service life of compressors.

How long do rotary screw compressor lubricants last?

Varnish and other unwanted substances quickly follow. With regular mineral oils, this process can begin after only one to two thousand hours in a rotary screw compressor. Synthetic lubricants are more stable than natural mineral oils and oxidize more slowly. Most full synthetics have an 8000-hour service life rating or more.

Which lubricant is best for screw compressors?

Their conclusion was that PAO lubricants were the best lubricants for rolling element bearings used in screw compressors. Pure PAO fluids have a tendency to cause certain low nitrile Buna-N elastomers and some other synthetic materials to become brittle and crack.

How does an air compressor lubricant valve work?

When the air compressor is first started, and the oil is cold, this valve will direct our oil straight into the air end and bypass the oil cooler. This will ensure the lubricant heats up quickly and can effectively perform all the tasks we demand of it.

Do flooded rotary screw air compressors need lubricating oil?

The principles and importance of clean, warm lubricating oil are the same for all flooded rotary screw-type air compressors, so though there may be a variance on the operational order in your air compressor, the principles and required components remain the same.
