How does an air compressor lubricant valve work?

When the air compressor is first started, and the oil is cold, this valve will direct our oil straight into the air end and bypass the oil cooler. This will ensure the lubricant heats up quickly and can effectively perform all the tasks we demand of it.

Do flooded rotary screw air compressors need lubricating oil?

The principles and importance of clean, warm lubricating oil are the same for all flooded rotary screw-type air compressors, so though there may be a variance on the operational order in your air compressor, the principles and required components remain the same.

How does a rotary screw air compressor stop?

To explain what happens, let's first look at how things should normally work. A normal stop procedure for a rotary screw air compressor (without vomiting back the oil!) looks like this: 1) Compressor runs loaded 2) Compressor runs unloaded 3) Compressor Stops. New compressors will automatically first switch to 'unload' before completely stopping.

How does compressed air escape from a compressor?

Trapped air wants to escape. Meanwhile, the compressed air tries any way possible to escape the air compressor. One way is back to the screw element and out through the inlet filter. A part of the air/oil mixture will make it back past the check valve and/or the oil-stop valve. And there will be a good amount of oil in the screw element already.

What happens if a compressor runs unloaded?

When the compressor runs unloaded, it is still running, but it is not actively pumping air or building any pressure. The inlet valve is closed, so no 'fresh' air can be sucked in. The screw element is turning but not taking in any new air.

What does it mean if your air compressor is vomiting oil?

I call this an 'oil vomiting' air compressor. It's when oil flows back out through the inlet filter, at the time that a screw compressor stops. So, it's a bit like vomiting. And if you've ever seen it happen, it really looks a bit like the compressor is vomiting oil. So why and when does this happen?
