What is an air compressor pipe?

Pipes or piping - The job of an air compressor pipe is to move air within the compressor. Pipes can be made out of various materials, including steel, copper, plastic or even rubber. Generally speaking, the pipe that is closest to the compressor (an inlet or suction pipe) is larger because it needs to draw in a large amount of air.

How do I find an air compressor part?

Find a Part, Any Part! Welcome to Air Compressor Services! Search by Part Number: If you know the part number, you can enter it in our search bar and easily find it that way.

What is the difference between a receiver and a reciprocating compressor?

Receiver - a receiver is a tank for storing compressed air. Sometimes, in a more complex operation, users will store air in multiple receiver tanks. Reciprocating Compressors - A reciprocating compressor is a machine that uses pistons, driven by a crankshaft, to push gas into a container.

What is a proper inlet pipe?

The proper inlet pipe brings the air from the filter to the compressor with no pressure loss and should not create operational problems with any type of self-contamination on the inside. It is important to realize that the ambient inlet air condition may well dictate the selection of one type of pipe over another.

What temperature should a rotary screw compressor be able to withstand?

Here we have more complex considerations: The discharge air from the compressors can be at 250 oF to 350 oF (for centrifugal, oil-free rotary screw and reciprocating types), or from 200 oF to 220 oF (for lubricant-cooled rotary screw compressors), so the pipe must be able to withstand those temperatures.
