

Screw air compressor overtime video tutorial

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What are the parts of a rotary screw air compressor?

The rotary screw air compressor has the following parts: The screws of the compressors are also known as rotors. A screw compressor has two rotors (male and female rotors) for the compression of the gas. The male rotor is connected with a shaft. As the shaft rotates, it also rotates the male rotor.

How do I get help with my air compressor?

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.

How do I know if my air compressor is working?

If you have a compressed air dryer, check the dewpoint. Check the current draw with a current clamp meter. If the motor draws excessive current: Try to turn the compressor by hand. It should be possible to turn it around. It should turn around smoothly, without any 'hiccups' (be sure to completely shut down the air compressor!).
