

Screw air compressor solenoid valve adjustment

How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

What is a screw air compressor intake valve?

The intake valve of the screw air compressor is a component that controls the air pressure in the air storage tank. Commonly used intake valves have a rotating disc structure and a reciprocating valve plate mechanism. The disc or valve plate is used to open or close the air inlet to control Airflow entering the nose.

What are the components of screw air compressor?

Screw air compressor is the main components of screw head, the separation of oil and gas cylinder. Screw suction filter through the nose and suction inlet control valve, oil also inject compressed room, a cooling of the nose, while the screw and the bearings lubricated by compressed air pressure that is generated.

What happens if a screw air compressor is too high?

Too high is a great waste of the energy of the screw air compressor. The intake valve of the screw air compressor is a component that controls the air pressure in the air storage tank. Commonly used intake valves have a rotating disc structure and a reciprocating valve plate mechanism.

How high should a screw air compressor tank pressure be?

Regardless of the intake valve, the tank pressure should be maintained between 1.0 and 2.0 BAR during unloading. Too high is a great waste of the energy of the screw air compressor. The intake valve of the screw air compressor is a component that controls the air pressure in the air storage tank.

How to adjust air compressor?

Air compressor used automatic correction system, so as long as the guarantee of a pulley in the same plane. First head of the pulley fixed in the right position, then adjust the motor on the belt at the same level surface. When the motor or nose been moved or re-installed, the patch must be re-coupling of.
