

What are the components of a drilling system?

The essential components of a drilling system are the rock drill, feed equipment, drilling rods, bit, supports against the drilling reaction, power source, and cuttings disposal equipment. Different drilling rigs are constructed with various combinations of these elements and other accessories for particular drilling purposes.

How rotary drilling rigs are used in open pit mining?

For large-scale open pit mining, it is common to use rotary drilling rigs equipped with three-cone bits or DTHs to drill blastholes. These tools are mechanically compatible with each other, and make it possible to choose the most efficient method according to the particular rock hardness. 2. Construction of Drilling Equipment

How does a hydraulic rock drill work?

The hydraulic rock drill uses high-pressure oil as the power to drive the piston to impact the drill bit, with an independent rotary mechanism. The piston is controlled by a valve to perform reciprocating motion, and the drilling speed is more than twice that of the pneumatic rock drill.

What type of drilling system do rigs use?

Rigs often can use a variety of rock and overburden drilling systems and all flush types. Drill rod/casing lengths as little as 1 m or as much as 20 m can be accommodated depending on project constraints.

Is overburden drilling more difficult than rock drilling?

As noted in Section 1, overburden drilling can be more complex and difficult than rock drilling, and is often far more controversial when consideration is given to levels of environmental acceptability.

What type of motor does a rock drill use?

Hydraulic or pneumatic rotation motors are most frequently used to rotate the rod, although small pneumatic rock drills often employ a rifle rotation system, in which the drilling rod is rotated by a piston via a rifle bar without the need for a pneumatic motor. 2.4.
