What is a rig Transfer Specification?

Also known as "Intra Rig Transfer Specification",this involves a very basic ASCII transfer formatintended primarily for sharing of information between service companies,though lending itself well as a simple entry point into wellsite data transfer.

What is a wellsite Information Transfer Specification (wits)?

Countries/areas where WITS services have been provided The WELLSITE INFORMATION TRANSFER SPECIFICATION (WITS) is a communications format used for the transfer wellsite data from one computer system to another.

What is a WITSML transfer?

WITSML transfers between systems usually means that the source of the data dictates all header and metadata information,which the receiving end must preserve unless tools are leveraged to manipulate/change this information.

How is information transmitted from a rig to a central site?

SPE Drill Eng 4 (04): 291-299. Information of many kinds,including drilling and mud-logging parameters,is transmitted electronicallyfrom rigs to central sites. The format of the transmitted information depends,at present,on the business entities involved in the information-transfer transaction.

How does ETP work in a drilling rig?

In an actual world situation, an application can use the protocol to open a communication channel with a sensor on the drilling rig and ask the sensor to stream real-time data. The communication does not require intermediary servers. ETP is also part of PRODML and RESQML. The transfer protocol uses WebSockets.

How does digital transformation affect a drilling rig?

For upstream operations,digital applications can create unprecedented synergybetween drilling rigs,production sites,and back offices. The use of technologies like cloud computing,real-time analytics,the Internet of Things (IoT),smart drones,machine learning,and manufacturing execution systems (MES) can help with digital transformation.
