How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

How do you fix a bad air compressor?

1. Dirty air filter. Clean or replace filter element. 2. Blown cylinder head gasket. Install new gasket. 3. Worn or broken low pressure intake or discharge valves. Install new valve plate. 4. Air leaks. Tighten joints. 5. Loose belts. Tighten or replace belts. 6. Speed too slow. Check speed. Receiver pressure builds up quickly on compressor. 1.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.

How do you connect a compressor to a roof ventilator?

Connect an exhaust duct from the compressor to the roof ventilator. Local exhaust ventilation to control temperature requires much lower air flow rate. If air is exhausted from the room, make-up air must enter the room. Local exhausting requires much less air flow. Connect an exhaust duct from the compressor to the roof ventilator.

What causes compressor pressure to build up quickly?

Receiver pressure builds up quickly on compressor. 1. Excessive water in receiver. Drain receiver/tank. 2. Speed too fast. Check speed. Reset mechanism cuts out repeatedly; fuses of proper size blow. 1. Motor overload. Shut down immediately to avoid damage. 2. Malfunction or improperly adjusted. Adjust or replace. 3. High ambient temperature.
