What is down-the-hole (DTH) drilling?

Down-the-hole (DTH) drilling has made it easier for contractors to drill wells faster and more efficiently, and to transition from dirt boring to rock boring just by adding a compressor and hammer to the drill bit.

What is DTH drilling?

DTH drilling, also known as Down-the-Hole drilling, is a method used to drill boreholes into the earth's surface. This technique involves a hammer that is located behind the drill bit and is powered by compressed air. The hammer directly strikes the drill bit, creating a powerful impact that allows for efficient and precise drilling.

How does a down-the-hole drill work?

Down-the-hole drills consist of various components such as hammers, bits, and pipes that work together to create boreholes. The hammer delivers rapid blows to the bit, while air pressure removes debris from the hole. These tools are designed to withstand high-impact forces and provide exceptional performance in challenging environments.

What are the advantages of using down-the-hole drilling tools?

The advantages of using down-the-hole drilling tools are numerous. They offer faster penetration rates and lower energy consumption compared to other methods, making them ideal for large-scale projects. Additionally, DTH drills are versatile and can be used in a wide range of geological formations, from soft soil to hard rock.

How long did it take to drill a 12,000 ft hole?

The original estimate for completion of a 12,000-foot hole was 30 days using the conventional rotary technique, which was reduced to 13 days using the DTH method. Before DTH was used, drillers would typically case the vertical portion of the well and convert to rotary drilling to drill at a tangent.
