Can you use air instead of water to drill a hole?

In other forms of drilling such as blasting work, air can be used for flushing instead of water, but the insistence on use of water for grout holes is to make sure that there is minimal chance for cuttings to be forced into cracks. Air can tend to do this, particularly in work below the water table, where it may produce a foamy slurry.

How does a drill work?

A method whereby water is pumped down a string of rods by motor water pump from which it emerges as a jet that cuts into the formation. Drilling may be aided by manually rotating the drill string or by moving it up and down in the hole. Cuttings are transported up by circulating water between the drill pipe and the borehole wall.

How do you drill a hole with one hose?

Paul Smith has an excellent technique that he has been kind enough to share. It only requires one hose. It involves using an air and water mixture to bring the cuttings up. He pumps both water and air down to the bottom of the hole. The water and air mixture then bring the cuttings to the top inside the drill pipe.
