How does a water well drilling rig work?

Water well drilling rigs employ different drilling methods, such as cable tool drilling and rotary drilling. In cable tool drilling, a heavy drill bit is repeatedly lifted and dropped to break through the ground. Rotary drilling, on the other hand, uses a rotating drill bit to cut through the soil and rock.

How do you know if a drilling state is rotary or slide?

Before we determine a drilling state to be rotary or slide, we check if pipe rocking is being performed. One thing to note is that pipe rocking systems differ from rig to rig. In some cases, the RPM signal is oscillating, whereas in other, the torque signal is oscillating. So, both types of rocking schemes should be identified by the algorithm.

What is the difference between rotary drilling and slide drilling?

In general, one of the more difficult rig states to distinguish between are rotary drilling and slide drilling. For the most part, one expects the top drive RPM and torque channels during slide drilling to be 0.
