The drillpipe had got stuck in the wellbore, there were numerous "lost circulation" events (where the drilling mud leaks out of the well through cracks in the rock) and "kicks" due to gas at unexpectedly high pressures entering the well from the formation.

How did a drilling rig explode?

The expanding gas shoved fluid out of the well at massive speeds, and this gas ignited on contact with the rig pump motors' electrical circuitry. At around 9:50 pm, the first explosion happened as pieces of drilling machinery were broken into bits and gallons of mud and oil splashed overboard. How did this devastating accident happen?
