How does a screw compressor work?

A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand. The inlet valve is controlled by a solenoid valve that supplies control air to the inlet/loading valve. Check solenoid valve coil and solenoid valve operation.

How do you connect a compressor to a roof ventilator?

Connect an exhaust duct from the compressor to the roof ventilator. Local exhaust ventilation to control temperature requires much lower air flow rate. If air is exhausted from the room, make-up air must enter the room. Local exhausting requires much less air flow. Connect an exhaust duct from the compressor to the roof ventilator.

How does an air compressor heat a lubricant?

Ambient atmospheric air is heated by passing it across the system's aftercooler and oil cooler, where it extracts heat from both the compressed air and the lubricant. Rule of Thumb: A 50-horsepower compressor rejects heat at approximately 126,000 Btu per hour. Two fluids of different starting temperatures flow through the heat exchanger.

How do I know if my air compressor is working?

If you have a compressed air dryer, check the dewpoint. Check the current draw with a current clamp meter. If the motor draws excessive current: Try to turn the compressor by hand. It should be possible to turn it around. It should turn around smoothly, without any 'hiccups' (be sure to completely shut down the air compressor!).

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.
