

# Why does the gasoline rock drill get hot

What happens if a drill is too hot?

Too much heat is a big problem for drills. It makes the drill bit's sharp edges wear out quickly, so it doesn't work as well. It's like using a pencil until the tip becomes flat and dull. Not to mention that the drill itself can get damaged, which means it won't last as long. Think of it like a phone overheating and not working properly.

How to reduce heat buildup while drilling?

Utilizing Cooling Aids and Cooling Lubricants: You can use cooling aids like a damp cloth or cooling lubricants to reduce heat buildup while drilling. The Benefits of Using Heat-Resistant Drill Bits: Heat-resistant drill bits can handle high temperatures better, ensuring they last longer and maintain their cutting performance.

Why do drills overheat?

Another major reason for the overheated drills is the covering of ventilation holes with our hands. It is a common mistake we make when using the drill. But, it does not allow the heat to pass, which overheats the drill quicker and affects your tool. Every drill has different torque that determines the strength of the drill.

How to prevent overheating during drilling?

Overheating can be prevented by giving your drill some rest. During intense drilling sessions, cooling is crucial to avoid overheating. Consider these cooling methods: Utilizing Cooling Aids and Cooling Lubricants: You can use cooling aids like a damp cloth or cooling lubricants to reduce heat buildup while drilling.

How do you know if a drill is overheating?

There is no correct answer to knowing the exact temperature when a drill gets overheated. Every drill works differently because of its unique components and functioning. Usually, overheating is more common, from 181.7 °C to 251.6 °C. Can Wood Catch Fire From Drilling? Yes, overheating can even lead to an external fire when working on the wood.

Why does my drill smell like it's burning?

Due to the overheating of the drill, you will smell like it's burning. The smell is because of the friction between the brushes that can create a spark if you constantly use the tool. Try changing the brushes or lubricating them properly to fix the issue.
