

Does QD FD affect hydraulic rock drill output power?

The effects of different the combination (Qd,Fd) on impact performance,including impact energy and frequency,are researched. These influences determine the output powerof the hydraulic rock drill.

Does rock-drilling efficiency increase with dynamic loading amplitude?

Then,a full-scale drilling experiment was conducted to study the rock-drilling efficiency. The results are as follows: the optimal frequency is higher than the resonance frequency of the rock. The impact energy increaseswith the dynamic loading amplitude.

How does impact frequency affect rock-drilling efficiency?

The impact energy increases with the dynamic loading amplitude. The penetration rate at dynamic loading amplitude of 4 kN (0.13137 mm/s) is 38.7% higher than that of 2 kN (0.09473 mm/s). When the impact frequency is lower than 150 Hz,the rock-drilling efficiency increaseswith the impact frequency and dynamic loading amplitude.

Do damping flow and feed force affect impact performance of Rock Drill?

The results show that damping flow and feed force have great influenceon impact performance of the rock drill. The maximum drilling power is obtained at the combination (Qd = 8 L·min -1,Fd = 16.25 kN),while the other parameters only obtain lower drilling power.

Does a double damping system improve energy absorption during rock drilling?

Conclusions The floating characteristics of internal components of the double damping system are analyzed,which can better solve the problem of energy absorption during rock drilling,but also has negative effects on the utilization of impact energy. The negative effects become obvious with the increase power of rock drill.
