

Zimbabwe oil-injected screw air compressor maintenance

How oil injected screw air compressor works?

The oil-injected screw air compressor has the characteristics of reliable running performance, few wearing parts, low vibration, low noise, and high efficiency. During the compression process, the compressor continuously sprays lubricating oil into the compression chamber and bearings by virtue of its own pressure difference.

How does a compressor lubricate rotors?

During the compression process, the compressor continuously sprays lubricating oil into the compression chamber and bearings by virtue of its own pressure difference. Lubricating oil has four main functions: Lubrication: Lubricating oil can form an oil film between the rotors, avoiding contact between the rotors and reducing friction.

Why should you lubricate a screw compressor?

Environmental protection: Lubricating oil can reduce the noise caused by high-frequency compression. The oil-injected screw compressor used by our company is a double-shaft positive displacement rotary compressor. The air inlet opens at the upper end of the casing, and the exhaust outlet opens at the lower part.

What is the function of oil inside a compressor?

The function of oil inside the compressor is for lubrication of screws, bearings and seals during operation, and secondly, for cooling screws. As air compression rises temperature (thermodynamic process) and overheating affects screws badly and can cause localized thermal stresses in mid length of screw (hotspots).

How to start a screw compressor?

Standard screw compressor is equipped with microprocessor control panel. When compressor is at stop status, press this button to start the compressor. the compressor and activate block mode function at the same time. -- Stop Button: When the compressor is at running status, press this button to stop the compressor.
